Abstract: The possibility, conditions, and limitations of the use of selective oxidative cracking of heavy components of fatty natural and associated petroleum gases for the production of gas-engine fuel that meets the requirements of manufacturers of gas-piston engines are considered.

Keywords: natural gas; associated petroleum gas; alkanes; gas-piston engines; self-ignition delay; methane number; lower calorific value; oxycracking

DOI: 10.30826/CE19120103

Acknowledgments

This work was performed within the framework of the Program of Fundamental Research of the Russian Academy of Sciences for 2013–2020 on the research issue of IChP RAS No. 47.16. Theme number in Federal Agency for Scientific Organizations: 0082-2014-0004. State registration number of Center of Information Technologies and Systems for Executive Power Authorities (CITIS): AAAA-A17-117040610283-3. The work was partially supported by the Skolkovo Foundation under Grant No. MG35/17.
