Abstract: The enthalpies of combustion and enthalpies of formation of three trinitromethyl derivatives of 1,3,5-triazine were determined by the calorimetric method. The data obtained can be used for calculating the energy capabilities of related compounds by the method of replacing functional groups. The thermochemical characteristics of trinitromethyl groups from 1,3,5-triazine derivatives are compared with the corresponding properties of these groups in azoles and nitroalkanes.

Keywords: explosives; thermochemical properties; 1,3,5-triazine; nitrocompounds; detonation
